

Royal Mughal Palace — Wedding Invitation Website

Developer build spec · Mobile-only single page site

This is a one-page digital wedding invitation, built for mobile screens only (no desktop layout needed). Theme: royal Mughal palace — burgundy, gold, ivory, warm candlelit lighting. The page opens with a short animation, then the user scrolls through sections in order. Below is what to build, section by section.

1. Colors

Name	Hex	Used for
 Burgundy Deep	#3D0F1C	Darkest background areas, vignette edges
 Burgundy	#5C1A2B	Main background color for most sections
 Burgundy Bright	#7A1F35	Buttons, highlighted cards
 Ivory	#F6EEDF	Card backgrounds, invitation message section
 Parchment	#EDE0C8	Countdown boxes, secondary cards
 Gold	#C9A227	Borders, dividers, icons
 Gold Light	#E8C874	Headings on dark background, glow effects
 Candle Glow	#FFB74D	Background glow effects only

Rule: backgrounds are mostly burgundy or ivory. Gold is only for borders, icons and text accents — never a large fill.

2. Fonts

Use	Font (Google Fonts)	Size (mobile)
Couple names, headings	Playfair Display (bold)	22–34px
Dates, quotes, accents	Cormorant Garamond (italic)	15–17px
Body text / paragraphs	EB Garamond (regular)	15–16px
Small labels (all caps)	EB Garamond (medium), letter-spacing 2px	10–11px

3. Page Structure (in order)

1. Opening animation (loads first, full screen)
2. Hero — couple names
3. Countdown timer
4. Invitation message
5. Event schedule (with Add to Calendar)
6. Venue cards (with Google Maps)
7. Closing / share section

Music toggle button stays fixed on screen (top right corner) through the whole page, not a separate section.

4. Opening Animation

This plays once when the site loads, before the user sees any scrollable content.

Step	What happens
1	Screen is dark burgundy. A closed invitation card fades in at the center, with a small circular "seal" icon on it.
2	Text below the seal says "Tap to Open". User taps it.
3	Seal icon fades out with a small particle/spark effect (~0.4s).
4	Two panels open outward like double doors (a CSS/JS 3D flip, ~0.8s), revealing the burgundy background behind.
5	Hero content (names, date) fades/slides up into place. Animation ends, page is now scrollable.

Build with GSAP or Framer Motion as one timeline. Keep total animation under ~6 seconds. Must work with a single tap — no complex gestures.

5. Scroll Behavior

- Each section fades in + moves up slightly (about 20px) when it enters the screen. Use `IntersectionObserver`.
- Animate each section only once — don't replay it if the user scrolls back up.
- Support `prefers-reduced-motion`: if it's on, just fade in with no movement.
- Keep it simple — no heavy parallax, no scroll-jacking. Just fade + slight rise per section.

6. Sections — What to Build

Hero — Couple Names

Background: Burgundy gradient, full screen height.

Content:

- Small label: "The Wedding Of"
- Couple's names, large text, gold color
- Thin gold divider line
- Wedding date
- Small scroll-down arrow icon at the bottom

Notes: Music toggle icon (circle button, top-right corner) is part of this section but stays visible on all sections (position: fixed).

Countdown Timer

Background: Burgundy, same as hero or slightly lighter.

Content:

- Heading text, e.g. "Until We Say I Do"
- 4 boxes: Days / Hours / Minutes / Seconds — parchment color background, gold border
- Numbers update live via JS, every second

Notes: Use a smooth crossfade or slide when digits change — not a hard flip/jump.

Invitation Message

Background: Ivory card, standing out from the burgundy page background. Thin gold border around it.

Content:

- Formal invitation text ("Together with their families...")
- Parents' names
- Small decorative divider at top and bottom

Notes: Just a static card with fade-in on scroll — no special animation needed here beyond the standard scroll fade.

Event Schedule

Background: Burgundy.

Content:

- A vertical line (timeline) down the left side
- One card per event (e.g. Mehendi, Nikah, Reception) — each with a dot on the timeline, event name, date, time
- Each card has an "Add to Calendar" link/button

Add to Calendar — how it works:

- Tapping it shows options: Google Calendar / Apple Calendar / Outlook
- Google Calendar → open a pre-filled Google Calendar link
- Apple/Outlook → generate and download a small `.ics` file

Venue Cards + Google Maps

Background: Burgundy page, cards are ivory/parchment.

Content per card:

- Venue name + address
- A map preview image (static map, not a live embed — for speed)
- Two buttons: "View on Map" and "Get Directions"

Google Maps integration:

- Use the **Google Maps Static API** for the small preview image on the card (loads fast, no heavy iframe)
- "View on Map" button → opens `https://www.google.com/maps/search/?api=1&query=LAT,LNG` (opens the native Maps app on mobile)
- "Get Directions" button → opens `https://www.google.com/maps/dir/?api=1&destination=LAT,LNG`
- Always show the plain text address too, in case maps fails to load

Closing / Share Section

Background: Burgundy, similar to hero — feels like the "end" of the page.

Content:

- Short thank-you line
- Share button

Share button — how it works:

- Use the **Web Share API** (`navigator.share()`) — this opens the native phone share sheet (WhatsApp, Messages, etc.)
- If the browser doesn't support it, show a small popup with a "Copy Link" button and a WhatsApp share link as backup

Background Music Toggle

Position: Fixed circle button, top-right corner, visible on every section.

Behavior:

- Default: muted (autoplay with sound is blocked by browsers anyway)
- Best approach: start music automatically right when the user taps to open the invitation (that tap counts as user interaction, so audio is allowed to play)
- Icon changes state: playing = small glow/pulse animation, muted = plain icon

7. Component Behavior (quick reference)

Component	Normal	On tap
Buttons	Solid burgundy or outline, gold text/border	Slight scale down (0.97), 150ms
Cards	Flat with soft shadow	Shadow slightly deeper on tap
Music toggle	Static gold ring	Ring pulses softly while playing

8. Tech Notes

- **Mobile only** — build for a fixed width around 375–430px. No need for a responsive desktop layout.
- **Suggested stack:** HTML/CSS/JS or React, with GSAP or Framer Motion for animations.
- **Keep it light:** opening animation should be built from SVG/CSS, not video — target under ~400KB total for animation assets.
- **Google Maps Static API** needs an API key — get this from Google Cloud Console before building the venue cards.
- Test the whole flow on a real mid-range Android phone before sending the link to guests.
